

Acme Robotics GmbH — Annual Report 2024

Acme Robotics GmbH is a fictional company created solely to demonstrate this document-QA application. Any resemblance to a real business is coincidental. All figures below are invented.

1. Company Overview

Acme Robotics GmbH was founded in 2011 and is headquartered in Dortmund, Germany. The company designs autonomous warehouse robots and the software that coordinates them. As of December 2024 the company employed 512 people across three offices: Dortmund, Munich, and Porto. The legal form is a Gesellschaft mit beschränkter Haftung and the company is registered in the Handelsregister of Amtsgericht Dortmund under HRB 998877.

2. Financial Highlights

Total revenue for the 2024 financial year was 84.6 million euros, up 23 percent from 68.8 million euros in 2023. Gross margin improved to 41 percent from 37 percent the previous year. Net profit was 9.2 million euros. Research and development spending reached 14.1 million euros, roughly 17 percent of revenue. Cash and cash equivalents at year end stood at 31.5 million euros, and the company carried no long-term debt.

3. Revenue by Region

Germany remained the largest market at 46 percent of revenue. The rest of the European Union contributed 33 percent, the United Kingdom 12 percent, and the remaining 9 percent came from a pilot programme in Canada. Management considers the Canadian pilot a strategic beachhead for North American expansion rather than a material revenue source in 2024.

4. Products

The flagship product is the AR-7 mobile picking robot, which accounted for 61 percent of unit sales. The AR-7 has a battery life of 11 hours and a maximum payload of 45 kilograms. It navigates using a combination of LiDAR and visual SLAM, and can operate safely alongside human workers without safety cages. The older AR-5 model remains available for price-sensitive customers and made up 18 percent of unit sales.

A cloud fleet-management platform, AcmeOS, is sold as an annual subscription and generated 22 million euros in recurring revenue, a figure that grew 40 percent year over year. AcmeOS coordinates robot traffic, schedules charging, and exposes a REST API for warehouse-management systems. The net revenue retention rate for AcmeOS subscriptions was 118 percent.

5. Leadership

The Chief Executive Officer is Jane Doe, who joined in 2019. The Chief Technology Officer is Miguel Santos, who co-founded the company. The Chief Financial Officer is Priya Nair, who joined from a logistics group in 2022. The company is governed by a five-member supervisory board chaired by Dr. Anke Vogel.

6. People and Culture

Headcount grew from 388 to 512 during the year. Engineering represented 54 percent of staff. Voluntary attrition was 6.9 percent, well below the industry average. The company offers a four-day work week in its Porto office as a pilot and reported an employee engagement score of 82 out of 100.

7. Sustainability

Acme Robotics reduced Scope 1 and Scope 2 emissions by 18 percent per unit shipped. All three offices run on certified renewable electricity. The AR-7 is designed for disassembly, and 92 percent of a returned unit by mass can be recycled. The company aims to be carbon neutral across Scopes 1 and 2 by 2028.

8. Risks

The most significant risks identified by management are supply-chain concentration in high-precision motors, of which a single supplier provides 70 percent, and foreign-exchange exposure to the British pound. A prolonged component shortage could delay AR-9 shipments. The company holds twelve weeks of critical component inventory as a buffer.

9. Outlook

For 2025 management expects revenue between 100 and 108 million euros, driven by the launch of the AR-9 robot and expansion into the French market. The company plans to hire approximately 120 additional engineers and to open a fourth office in Lyon. The AR-9 is expected to offer a 30 percent higher payload than the AR-7 and to begin shipping in the third quarter of 2025.
